Desktop Edge

Most woods feature square edges, but cedar and mesquite are available with a barkline option (also known as a “live edge”) at no extra charge. You can choose a barkline on the front edge with a square back, or on both the front and back edges. The barkline provides a unique, rustic look to the desk, and has long been a favorite of our customers. Cedar and mesquite are also available with the standard square edge.

Mesquite

Barkline front and back

Square front and back

Cedar

If you want a more consistent surface with less filler, select a square desk finish. Desks with a straight edge have fewer desk edge imperfections because we cut away the character that exists near the bark of the tree.

If you choose the barkline option, you may notice that your desktop has more character towards the outer edge. The cedar barkline is fairly uniform, so you will see wood grain and bark contours. The mesquite barkline is more prone to bug trails. We use a clear or black filler where bug trail marks or cracks occur.

UPLIFT DESK[®] SOLID WOOD DESKTOP

Desktop sides are always square, with slightly rounded edges. Close ups of the edge can be seen below:

Mesquite (Square)

Cedar (Barkline)

Notes

- All solid woods use filler to smooth out knots, bug holes, and imperfections in the wood. Filler is usually black or clear, but other colors may be used at the woodworker's discretion
- Tops are 1.75" thick, with the exception of premium bamboo, which is 1.5" thick
- Cedar, while a beautiful option, is also a fairly soft wood. Applied pressure can result in indentations
- Certain woods will look lighter when new, but will darken over time. Cherry, mesquite, sipo mahogany and walnut are especially prone to these natural variations
